StealthSurfer Stealth Surfer is a hardware-based product that is easily transportable as a USB 1.1 Flash/Pen drive and is a creative and easy way to hide your tracks when you surf the web.

How does it work? Simply plug it into your USB port and surf the web. The Stealth Surfer will be busy downloading all of your history and temporary internet files onto the device, and when you're done surfing, unplug it and take it with you. You can guarantee complete privacy as long as you have the device with you.

Sizes of the device range from 64, 128, or 512 MB. Because of the direct transfer to the drive, there may be some slow down when using a high-speed connection, with USB 1.1 being a bottleneck in the transfer rate. Click our audio link above to hear more as GPF's Jeremy Smith explains more about this one-of-a-kind security device.
